- Schematic
- Constraints
- Build the design
- First Success!
- Simulation
- Verilator Driver
- **Bus Signals**
- Internal Signals
- Schematic
- Circular Logic
- Sim Result
- Examples
- Examples
- Exercise
- Conclusion

- What is a wire?
- What can I do with it?
- How do I build a design?

#### Objectives

- To get an initial, basic familiarization with combinational logic
- To learn how to run the tools to build a design
- To get an initial design running on an FPGA board

Lesson Overview

First design

Examples
Examples
Exercise
Conclusion

```
module thruwire(i_sw, o_led);
    input wire i_sw;
    output wire o_led;

assign o_led = i_sw;
endmodule
```

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples Exercise

Conclusion

```
input wire i_sw;
output wire o_led;

assign o_led = i_sw;
endmodule
```

- Verilog files contain modules
- This module is named thruwire
- While Verilog allows more than one module per file,
   I recommend only one module per file.

Lesson Overview

Examples
Exercise
Conclusion

```
module thruwire(i_sw, o_led);
    input wire i_sw;
    output wire o_led;

assign o_led = i_sw;
endmodule
```

- The module keyword marks the beginning
- endmodule marks the end of the module

Lesson Overview > First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver **Bus Signals** Internal Signals Schematic Circular Logic Sim Result Examples Examples

Exercise Conclusion

```
module thruwire(i_sw, o_led);
input wire i_sw;
output wire o_led;

assign o_led = i_sw;
endmodule
```

- This module declare two ports, i\_sw and o\_led
- The first is declared to be an input
- The second an output
- Both are wire's, but we'll get to that later

Lesson Overview

First design
Schematic
Schematic
Constraints
Build the design

Examples

Examples
Exercise
Conclusion

Let's build a simple Verilog design

```
module thruwire(i_sw, o_led);
    input wire i_sw;
    output wire o_led;

assign o_led = i_sw;
endmodule
```

 Our one piece of logic sets o\_led to be the same as i\_sw

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples Exercise

Conclusion

Let's build a simple Verilog design

```
module thruwire(i_sw, o_led);
    input wire i_sw;
    output wire o_led;

assign o_led = i_sw;
endmodule
```

FPGA's are commonly used as:

- Traffic cops
   A programmable/adjustable wire fabric
- Voltage level shifters
- This logic would be appropriate for each...it generates a simple "wire" through the chip

### **Schematic**

Sim Result

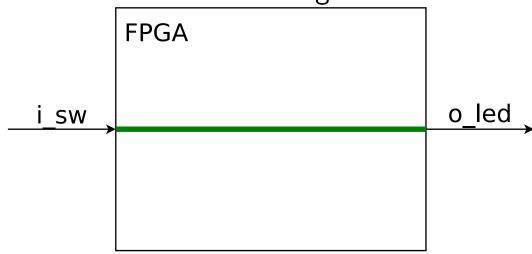

Examples

Examples

Exercise

Conclusion

Here's what a schematic of this design would look like

All from this assign statemnt

```
assign o_led = i_sw;
```

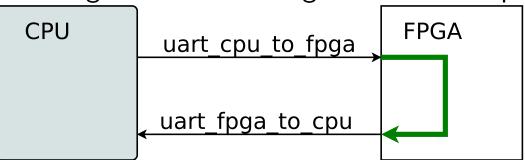

### **Schematic**

Lesson Overview
First design
Schematic

→ Schematic
Constraints
Build the design
First Success!
Simulation
Verilator Driver
Bus Signals
Internal Signals
Schematic
Circular Logic
Sim Result
Examples

Examples
Exercise
Conclusion

A very similar design would make a good first serial port test

 Your circuit board should pass this test before you try to implement your own serial port within it

### **PCF** File

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples

Exercise

Conclusion

If you are using nextpnr, you'll need to create a PCF file

- Maps top-level ports to pins
- You'll find P13 and C8 on the schematic
  - Find the FPGA pins connected to the switch...and the LED output
  - If your design has no switches, you can use buttons (for now)
    - Buttons also bounce, but we'll get to that later

### **UCF** File

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples Exercise

Conclusion

If you are using ISE, you'll need to create a UCF file

```
NET "i_sw" LOC = "P9" | IOSTANDARD = LVCMOS33;
NET "o_led" LOC = "N3" | IOSTANDARD = LVCMOS33;
```

- This would be for the older Xilinx FPGA's
- Make sure you actually look up the correct pins
- P13 for one board might be something else on another
   On this board, the switch is on pin P9
- Most development boards use the 3.3V LVCMOS standard
   You should know if your board is different

### **XDC** File

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples Exercise

Conclusion

If you are using Vivado, you'll need to create a XDC file

- This would be for the newer Xilinx FPGA's
- Usually, the vendor will provide a "master XDC" file
- From there, you should be able to
  - Rename the appropriate ports to i\_sw and o\_led
  - Comment out every other I/O port

# Build the design

Circular Logic
Sim Result
Examples

Examples

Exercise Conclusion

For an iCE40 design, this will look like:

You'll need to do this for every project—get used to this flow.

A makefile can drastically simplify this process

You should now have a file thruwire.bin that you can load onto your board.

If you aren't using an iCE40, follow your chip vendor's instructions

### First Success!

Examples

Exercise

Conclusion

Follow your board vendor's instructions for loading this file onto your board.

Notice now that every time you flip the switch, the LED responds Yaaaayyyyyy!!! Your first FPGA design.

### **Simulation**

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver **Bus Signals** Internal Signals Schematic Circular Logic Sim Result Examples Examples

Exercise Conclusion

C				•			_	
Simula	ation	IS	an	ım	portant	part	O†	design

Simulation	Hardware			
Can trace all signals	Can only see some signals			
Extended tests cost GB	Extended tests are simple			
Easy to debug	Hard to debug			

Because hardware is so hard to debug, simulation is vital

A successful complex project

... requires simulation!

#### **Verilator**

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples Exercise

Conclusion

Let's now build our design using Verilator

```
% verilator -Wall -cc thruwire.v
% cd obj_dir/
% make -k Vthruwire.mk
```

- Verilator compiles Verilog into C++ placed into obj\_dir/
- The make command then builds this converted C++ file into a shared object file we can now use

Examples

Examples

Exercise

Conclusion

```
int main(int argc, char **argv) {
           // ...
           for(int k=0; k<20; k++) {
                // We'll set the switch input
                // to the LSB of our counter
                tb \rightarrow i_s w = k \& 1;
                tb->eval();
                // Now let's print our results
                printf("k_{\perp} = \frac{1}{2}d, ", k);
                printf("sw_{\sqcup} = _{\sqcup} %d,_{\sqcup}", tb \rightarrow i_{-}sw);
                printf("led_{\square} = _{\square} %d \n", tb->o_led);
           }
```

# **Building it all**

Examples

Conclusion

Exercise

Last step, let's put it all together:

```
% g++ -I /usr/share/verilator/include
% /usr/share/verilator/include/verilated.cpp \
% obj_dir/Vthruwire__ALL.a
% thruwire.cpp -o thruwire
```

Wow, that's pretty complicated.

You should have a Makefile in your ex-01-thruwire directory with both the code and the build instructions.

```
% cd ex-01-thruwire/
% make
# (Make output skipped for brevity)
%
```

### **Simulation**

Examples
Examples
Exercise
Conclusion

That was one single wire. We can also declare values consisting of many bits.

```
input wire [8:0] i_sw;
output wire [8:0] o_led;
```

#### This defines

- i\_sw to be 9-input wires, and
- o\_led to be 9-output wires

# **Internal Signals**

**Bus Signals** 

▶ Internal Signals

Schematic

Circular Logic

Sim Result

Examples

Examples

Exercise

Conclusion

You can also declare and work with internal wires

```
wire [8:0] w_internal;
```

These wires can now be used in logic

```
assign w_internal = 9'h87;
assign o_led = i_sw ^ w_internal;
```

#### Literals

Lesson Overview

First design

Schematic

Schematic

Constraints

Build the design

First Success!

Simulation

Verilator Driver

**Bus Signals** 

Schematic

Circular Logic

Sim Result

Examples

Examples

Exercise

Conclusion

A Verilog literal is defined as

- A width
- An apostrophe
- A numeric type: h, d, o, b, sd
- The value: a series of digits, possibly containing underscores

#### Examples include:

1'b0 1'b1 2'b01 4'b0101 4'h5 -7'sd124 32'hdead\_beef

### **Operators**

Lesson Overview
First design
Schematic
Schematic
Constraints
Build the design
First Success!
Simulation

Verilator Driver

Schematic

Circular Logic

Sim Result

Examples

Examples

Exercise

Conclusion

#### The Verilog language supports the following operators

+	Addition	_	Subtraction	
<<	Left Shift	>>	Right shift	
_	Unary negation	?:	Tertiary operator	
~	Bit-wise negation	^	Bit-wise XOR	
	Bitwise OR	&	Bitwise AND	
	Logical OR	&&	Logical and	
!	Logical negation	>>>	Arithmetic right shift	
==	Equality	! =	Inequality	
<, <=	Less than (Equal)	>, >=	Greater than (Equal)	
Limited, use with care		Avoid within logic		
*	Multiplication	/	Division	
		%	Remainder	

- Some FPGA's support native multiplication
- None support a single clock divide

### **Schematic**

Examples

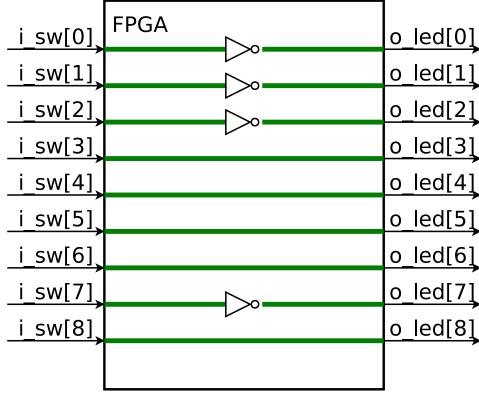

Conclusion

Exercise

#### From this code:

```
assign w_internal = 9'h87;
assign o_led = i_sw ^ w_internal;
```

Get this internal structure:

# Circular Logic

Lesson Overview
First design
Schematic
Schematic
Constraints

Build the design

First Success!

Simulation

Verilator Driver

Bus Signals

Internal Signals

Schematic

Circular Logic

Sim Result

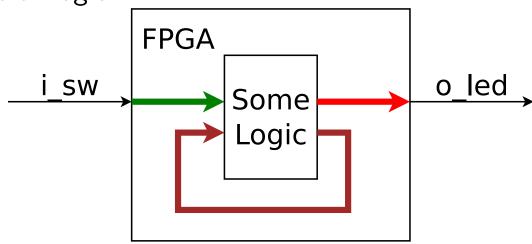

Examples

Examples

Exercise

Conclusion

Avoid circular logic!

Example:

```
assign \quad o\_led = i\_sw + o\_led;
```

- This doesn't work in hardware like it might in software
- This is roughly equivalent to creating a short circuit
- Most tools will fail to build such designs

## **Updated Driver**

Exercise

What can you do with wires and wire logic? Example: Multiplexer

```
input wire    i_a, i_b, i_sel;
output wire    o_out;

assign o_out = (i_sel) ? i_a : i_b;
```

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Exercise

Conclusion

What can you do with wires and wire logic? Example: Multiplexer

```
input wire i_a, i_b, i_sel;
output wire o_out;

assign o_out = (i_sel) ? i_a : i_b;
```

- This is a good example of the tertiary operator
- Interested in making a connection to one of two serial ports?
- How about connecting one of two bus masters to an interconnect?

We'll get to these examples later.

Examples

Exercise

Conclusion

What can you do with wires and wire logic? Example: Parity check

```
input wire [7:0] i_word;
output wire o_parity;
assign o_parity = ^i_word;
```

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver **Bus Signals** Internal Signals Schematic Circular Logic Sim Result Examples 

Exercise Conclusion

What can you do with wires and wire logic? Example: Parity check

This form of XOR is a reduction operator

- It XORs all the word's bits together
- $exttt{ iny Other reduction operators include} \mid exttt{and } \&$

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver **Bus Signals** Internal Signals Schematic Circular Logic Sim Result Examples 

Exercise Conclusion

What can you do with wires and wire logic? Example: Interrupt detector

```
input wire [7:0] i_irq_source;
output wire o_irq;

assign o_irq = |i_irq_source;
```

- □ i\_irq\_source contains eight interrupt sources
- o\_irq is true if any interrupt source is true

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Exercise

Conclusion

What can you do with wires and wire logic? Example: CPU stall determination

```
assign \quad dcd_stall = (dcd_valid)\&\&(op_stall);
```

From the ZipCPU, the decode stage must stall if

- It has produced a valid result, and
- The next stage, read operands, is stalled for some reason
   These stalls can back up through the CPU
   Ex. Read operands might be stalled if the ALU is stalled

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver **Bus Signals** Internal Signals Schematic Circular Logic Sim Result Examples 

Exercise Conclusion

What can you do with wires and wire logic?

Example: Determining if there's a phase error in a phase lock loop

```
assign phase_err = (output_phase != input_phase);
```

In this case, the loop will adjust if there are any errors

#### **Exercise**

Lesson Overview First design Schematic Schematic Constraints Build the design First Success! Simulation Verilator Driver Bus Signals Internal Signals Schematic Circular Logic Sim Result Examples Examples

> Exercise

Conclusion

This section has two exercises:

- 1. Build and try the thruwire demo.
  - Toggle the switch.
  - Verify that toggling your switch will toggle the LED
- 2. Create a test of your serial port connection
  - Connecting the input serial port wire to the output
     Beware: These wires are often marked "TX" and "RX",
     but not always from the perspective of the FPGA
  - Turn off any 'local echo'
  - Turn off any hardware flow control
  - Verify that characters typed into your terminal program show up on the screen

➤ Conclusion

- Wires represent connections within the design
- Wires can also represent the outputs of combinatorial logic
- Wires have no memory, circular logic or feedback is illegal
- You know how to create constraints for your project!

You can now build and load a design onto an FPGA!
